
US Internet User Data Still Unprotected

29/03/2017

Washington, March 29 (Prensa Latina) US Internet access providers still have today the possibility to sell their customers' personal data to third parties without the obligation to obtain explicit permission.

As the Senate did last week, yesterday the House of Representatives approved with 215 votes in favor and 205 against the annulment of a regulation of the Federal Communication Commission that regulated the matter.

The text, which came out in 2016, had not yet come into force, newspaper reports said, adding that the new rule should be signed by President Donald Trump in the coming days.

By its part, civil right defender organizations criticized the decision of Congress because it allows the uncontrolled dissemination of personal data.

Among such information -they exemplified- religious beliefs, political positions, sexual orientation and health states of users can be revealed.

According to Natasha Duarte, from the Center for Democracy and Technology, these issues are among the most intimate in a person's life, and consumers must be able to control what companies do.

Users' data belong to consumers, not to providers, Democrat John Lewis wrote on the social network Twitter.

In his opinion, personal information should not be sold for profit by entities that offer access to the so-called network of networks.
